

Topic: Proportion

| Topic/Skill | Definition/Tips | Example |
|-----------------------------------|--|---|
| 1. Direct Proportion | <p>If two quantities are in direct proportion, as one increases, the other increases by the same percentage.</p> <p>If y is directly proportional to x, this can be written as $y \propto x$</p> <p>An equation of the form $y = kx$ represents direct proportion, where k is the constant of proportionality.</p> |  |
| 2. Inverse Proportion | <p>If two quantities are inversely proportional, as one increases, the other decreases by the same percentage.</p> <p>If y is inversely proportional to x, this can be written as $y \propto \frac{1}{x}$</p> <p>An equation of the form $y = \frac{k}{x}$ represents inverse proportion.</p> |  |
| 3. Using proportionality formulae | <p>Direct: $y = kx$ or $y \propto x$</p> <p>Inverse: $y = \frac{k}{x}$ or $y \propto \frac{1}{x}$</p> <ol style="list-style-type: none"> 1. Solve to find k using the pair of values in the question. 2. Rewrite the equation using the k you have just found. 3. Substitute the other given value from the question in to the equation to find the missing value. | <p>p is directly proportional to q. When $p = 12$, $q = 4$. Find p when $q = 20$.</p> <ol style="list-style-type: none"> 1. $p = kq$ $12 = k \times 4$ so $k = 3$ 2. $p = 3q$ 3. $p = 3 \times 20 = 60$, so $p = 60$ |
| 4. Direct Proportion with powers | <p>Graphs showing direct proportion can be written in the form $y = kx^n$</p> <p>Direct proportion graphs will always start at the origin.</p> | <div style="border: 1px solid black; padding: 5px;"> <p style="text-align: center; margin: 0;">Direct Proportion Graphs</p>  </div> |

5. Inverse Proportion with powers

Graphs showing **inverse proportion** can be written in the form $y = \frac{k}{x^n}$
Inverse proportion graphs will never start at the origin.

Inverse Proportion Graphs
