## Topic/Skill **Definition/Tips** Example 1. Parallel Parallel lines never meet. 2. Perpendicular lines are at right angles. Perpendicular There is a 90° angle between them. vertex 3. Vertex A corner or a point where two lines meet. Angle Bisector: Cuts the angle in 4. Angle **Bisector** half. 1. Place the sharp end of a pair of compasses on the vertex. 2. Draw an arc, marking a point on each line. Angle Bisector 3. Without changing the compass put the compass on each point and mark a centre point where two arcs cross over. 4. Use a ruler to draw a line through the vertex and centre point. 5. **Perpendicular Bisector: Cuts a line** Perpendicular in half and at right angles. **Bisector** 1. Put the sharp point of a pair of Line Bisector compasses on A. A B 2. Open the compass over half way on the line. 3. Draw an arc above and below the line. 4. Without changing the compass, repeat from point B. 5. Draw a straight line through the two intersecting arcs. The **perpendicular distance** from a 6. Perpendicular point to a line is the **shortest** from an distance to that line. **External Point** 1. Put the sharp point of a pair of compasses on the point.

**Topic: Loci and Constructions** 

|   | <ol> <li>Draw an arc that crosses the line twice.</li> <li>Place the sharp point of the compass on one of these points, open over half way and draw an arc above and below the line.</li> <li>Repeat from the other point on the line.</li> <li>Draw a straight line through the two intersecting arcs.</li> </ol>   |   |
